

1. A brief description of your organisation and what it does.
2. The workplace problem you aim to solve with your application.
3. How you will plan solve this problem with your application.
4. The requirements of the application.
5. Any additional design details for your application you think are relevant.

Software Fundamentals 3.4.1 python project plan

I will be creating a python application for a gymnastics club, Silver Springs Gymnastics Club, that provides training and gymnastics classes for children and teenagers. The aim of the club is to encourage young people to find enjoyment in staying fit, keeping active, and to develop and nurture their skills and talents, through regular gymnastics training. Silver Springs employs 10 coaches and 5 administrators who manage around 100 members, ranging in age between 3 - 18, and skill levels: beginner, intermediate, and advanced. The club offers various memberships: recreational, development, and competitive. The appropriate membership is decided based on age, skill level, and the amount of sessions per week, priced between £25 and £65 per month.

Currently, the club records all member information using handwritten forms and paper files. This makes it difficult to update individual memberships' personal details, payments, and to look up specific information about members. As the club grows, the workload becomes increasingly difficult to manage, which has been leading to an increase in admin errors, and is highly inefficient. Therefore, the club needs to digitalise their administration processes by creating an application that allows staff to easily and quickly view members' information, add new members, edit current members, and delete members. This will ensure data is organised, user-friendly, and efficiently managed. The introduction of this application will reduce human error e.g. duplicate entries, lost information, keep accurate and up-to-date records, and generally save time on administrative tasks, as all information will be kept in one place.

The requirements of this application are to store at least 10 records, each with 8 fields of data consisting of, ID, name, age, gender, membership type, join date, monthly fee, skill level, and number of sessions per week. It will provide the user with the option to add, edit, delete, and view specific or all records, whilst displaying information clearly and simply, in order to be user-friendly to all, as well as using simple validation to avoid duplicate IDs or missing information.

The application will be designed with a menu interface and simple instructions to make navigation easy for non-technical users. I will also be persisting the data to a CSV file for accurate and up-to-date record keeping.
